Client API FAQ Document

Get to know the Client API

What are the benefits of the Client API?

With the Client API, we offer our Resellers the following opportunities:

- Easy REST API implementation
- Automated order placement
- Full access to the FLYERALARM product catalog
- Print data check for your convenience
- Neutral shipping for your customers
- Proactive updates about the orders

Which delivery countries are available through the Client API?

Currently, the following delivery countries are available to place an order to through the Client API.

- Germany (DE)
- Austria (AT)
- Belgium (BE)
- Switzerland (CH)
- Denmark (DK)
- Spain (ES)
- France (FR)
- Italy (IT)
- Netherlands (NL)
- Sweden (SE)
- United Kingdom (UK)
- Portugal (PT)
- Croatia (HR)
- Romania (RO)
- Luxembourg (LU)
- Ireland (IE)
- Hungary (HU)
- Czech Republic
- Poland
- Slovakia

Furthermore, the range of the delivery countries is constantly getting expanded and updated.

Whom should I ask for assistance in case of questions or technical issues during the Client API usage?

You are welcome to raise a ticket through the ServiceNOW section available in the StartNOW V3 or contact us via service@flyeralarm.pro.

Our team is always happy to support you with all open points or questions!

What is the frequency of the product catalogue update for the Client API?

The Client API updates the product catalogue three times a week. The changes include various details of the product data itself, such as new/changed product variants, quantities, and shipping times.

Do I have always to implenent the Client API into my system or webshop to be able to place the order?

It is also possible to make the order "manually", as you have the opportunity to use only the UI as a service of the Client API, called StartNOW V3.

Will I have benefits or experience differences in case of the Client API implementation compared with the StartNOW V3 usage?

Yes, the Client API implementation provides more flexibility during the usage (e.g., the opportunity to use the desired payment method such as "prepayment" or "invoice" during the order placement).

Will I be able to have a testing phase for the Client API endpoints before going LIVE?

It is definitely possible to test everything before going LIVE. We will be happy to provide a "demo" access to check all use cases and endpoints for the full security.

Client API and its Onboarding Process

How does the overall Client API onboarding process look like? What are the main steps to take?

Feel free to have a look at our detailed guidelines on the onboarding process for the Client API.

How can I get access to the Client API?

With the Client API, you get tokens (valid for 12 months) based on a new Flyeralarm webshop account(s) for each desired country. We will be happy to grant you the tokens based on your request as soon as the mentioned webshop account is registered.

Please note that the registered webshop account(s) must be used only for the orders placed via the Client API and/or its frontend StartNOW V3.

How can I create a webshop account to have an access to the Client API ?

From your side, we will need only an email address never used before for any Flyeralarm webshop account creation. Afterwards, feel free to contact us via service@flyeralarm.pro to get more insights on the webshop account registration.

Our team will guide you through the process, depending on the desired country and other details.

Please note, that the webshop account registered for the Client API and/or StartNOWV3 access must always be used only for their orders.

What is token?

The token is your individual access for the Client API usage and serves as the authorization method to execute the API endpoints. We are happy to provide you with demo and/or live tokens depending on your current phase and needs.

In case of only StartNOW V3 usage, you don't need to worry about the token at all. You login using your credentials from the account creation in the FLYERALARM Webshop.

What is the difference between the demo and live tokens?

The demo token provides our customers with the opportunity to get familiar with the Client API and do the necessary testing in the same live environment, which will be used later also for live orders

Meanwhile, the live tokens are already used for the live "real" orders placed via the Client API.

The only difference between the demo and live tokens is the payment method, as the demo token has the default prepayment method to avoid any test orders accidentally going to production.

So, it is not allowed to pay for test order with the mentioned prepayment method, as the demo token is used only for the testing phase and orders that should not be produced.

Can I use the Client API token(s) of one country to place an order or retrieve prouct data for another country?

The API token is always unique and refers to its according country, and orders can be praced only for that country with its delivery and sender address.

For example, you can place an order with a token for Germany only with a delivery and sender address located in Germany.

I see the message “Access Restricted” after the registration of my webshop account. Did I do something wrong?

Most probably, you see the message "Access Restricted", as we haven’t set up the necessary settings and granted you the tokens yet. Please contact service@flyeralarm.pro, and our team will be happy to guide you through the next steps and grant the according access.

Does Client API have a staging environment for the testing?

Client API provides only live environment for its customers. However, we are happy to provide you with a demo token for the desired country, designed exactly for the testing purposes. It provides our customers with the opportunity to get familiar with the Client API and do the necessary testing in the same live environment, used later also for live orders.

Can we have multiple valid tokens at the same time to support a staged rollout?

Generally, one demo and one live tokens per desired country are sufficient to conclude the testing and later, the live order placement accordingly.

You are free to get them for each delivery country you prefer.

Is it possible to track the test order within “In Production” or “Shipping” statuses during the testing?

Generally, the testing process excludes the test orders going into production. For this purpose, the demo tokens were granted with the default prepayment method to restrict the test orders going into production.

I finished my testing phase and want to go LIVE. What’s next?

We will be happy to grant you the live access/token after getting your approval of the successful testing and live token request.

Please note that the live tokens are provided when the reseller contract is signed.

Feel free to contact our team via service@flyeralarm.pro for further support.

When a token is close to its one-year expiry, will I receive an automatic notification? If yes, how far in advance?

As soon as the token expiration date is coming closer, you will receive an automatic email with the new token sent two weeks in advance to the technical contact person email address, which you had specified earlier.

Can we generate tokens ourselves, or will your team issue new tokens for us each year?

Our team will be happy to issue for you the new token(s) when the previous one(s) expire(s). If there are any new opportunities to generate the token from your side, of course, we will inform you immediately.

Migration to Client API: *relevant only for Reseller API users*

What is the difference between the Reseller API and Client API?

The Client API is the new and improved version of the previous Reseller API.

At some point of time, the old version of the API will not be maintained anymore. Thus, we organize and support as smoothly as possible the migration process to the Client API for all our resellers.

The new system not only provides with the same experience and features as the Reseller API/StartNOW V2, but also grants more opportunities, including:

- Improvements and new features development only for the new system (e.g., webhooks, order placement via Variant ID + amount)
- Even safer and more efficient system for the long-term development
- Development aligned with the Flyeralarm new catalogue

Feel free to contact us via service@flyeralarm.pro, and our team will assist you with any open question.

How does the overall Client API migration process look like? What are the main steps to take?

Feel free to have a look at our detailed guidelines on the migration process to the Client API.

Can I use my usernames from the previous Reseller API accounts to generate tokens for Client API?

With the new Client API, we grant you directly a token valid for 12 months and ready for your usage as a safer and more improved way of authentification from the IT perspective.

See the migration guidelines and the “Client API and its Onborarding Process” for more details.

Can I check the details of the order placed via the Reseller API with the Client API endpoints?

It is not possible to check the order details placed with Reseller API with Client API endpoints (or viceversa), as each order placed corresponds to the identical account and token(s) according to each system.

Although generating a token via username/email and password is no longer required, is that method still available as an alternative?

The endpoint generating the token from the Reseller API is not available in our Client API, as we eased the process by making it more user-friendly with the long-term token generation from our side (as mentioned, for 12 months).

With the migration to the Client API, do I need to migrate also for the Resellers Portal and its ServiceNOW system?

The accesses to the Resellers Portal will be granted newly with the Client API account(s), as the previous accounts will be deactivated. You will get the necessary access from our Sales team.

Feel free to contact us via service@flyeralarm.pro for further details.

Is it possible to see my orders placed previously via the Reseller API and/or StartNOW V2 after the migration to the Client API and/or StartNOW V3?

Yes, we provide the opportunity to migrate also the order history and/or the address book for the last 365 days. Please note that the data switch is done only once after the full migration to the Client API with your explicit confirmation.

How the order history and/or address book migration to the Client API/StartNOW V3 works?

After the switch to the Client API/StartNOW V3, we will wait until all orders placed earlier via the Reseller API/StartNOW V2 have at least the status “In Production” to proceed with the migration.

Meanwhile, you can freely use the Client API/StartNOW V3, and we will parallelly migrate the necessary data, which will be archived for the new accounts in case of need. After the migration, we will already deactivate the previous Reseller API/StartNOW V2 accounts.

During the process, it will be essential not to make any new orders via the Reseller API/StartNOW V2, so we can make the migration once.

Can I use the same product group/variant/quantity IDs from Reseller API to call the Client API endpoints?

Yes, currently the current API works with the same group/variant/quantity IDs as the previous Reseller API. Furthermore, we provide now an additional choose between calling the according endpoints via the Quantity ID or Variant ID + amount (after checking the available amounts for the certain product).

Client API and the New Flyeralarm Catalogue

I have noticed that for some products the attribute range is much wider on the Flyeralarm webshop compared with the Client API and its StartNOW V3. Will the additional options be added to the Client API/StartNOW V3 later or is the product range just smaller there?

FLYERALARM is currently switching the product catalogue to a new product data model with more advanced and broader variety of products to choose from. It leads to the current amount difference for the attributes between the FLYERALARM webshop and the Client API.

However, the Client API is also in a step-by-step learning process to adapt to the new data model. You can already see there Bonuscard as one of the first bright examples from “new world”.

Is there a timeline for the new product catalogue to be fully available on the Client API/StartNOW V3?

The switch to the new world itself is done very gradually to evaluate carefully all potential factors and changes. So, we will have to get back to you additionally on the approximate timeline on a later point of time.

I could see some products available in the format of the new catalogue on the FA webshop but not in the Client API. Is this a coincidence?

Since we carefully calculate and plan all steps to align the growth of the new catalog with your best experience, you may still see some ID format differences between the Client API and webshop.

We always recommend to rely on the information provided via the Client API for its implementation and the endpoints execution.

I have noticed that the product page from the new catalogue differs significantly from the other configuration steps. For example, the configuration representation by icons available earlier no longer applies here. Will they be added later during the product catalogue migration?

In the "new world" with the wider choice of products/options, only the configurator will be available without the visual icons.

For some of the first products from the “new world”, there are no dependencies between the attributes selection criteria, compared to the old product catalog. Is this a feature of the new product catalog or just a coincidence?

The independence between the features may be rather a coincidence than a rule, as there may be cases for other new products with more options and the according dependence to maintain the data correctly.

So, the changes you see visually is more connected with the fact that the configurator is now placed on one page and not step by step, while there is still the dependence between the features when needed.

What is the distinction between the ID and SG-ID mentioned in the Client API documentation?

FLYERALARM is currently switching the product catalogue to a new product data model with more advanced and broader variety of products to choose from. The IDs and SG-IDs represent the numbers/IDs of the certain product from “old world” and upcoming “new world” accordingly.

For now – only a few product groups are switched to our new data model, and we still provide the “old” product groups to our resellers with old variant IDs. At the moment, you can still freely order via the existing variant IDs without any issues.

Will the switch of the product catalogue to the new format lead to changes in the current product group/variant/quantity IDs completely?

Yes, once the Client API learns and adapts the products and new variants from the FA Webshop, the current variant IDs will be replaced with the new ones without Quantity IDs. Instead of quantity IDs it will be possible to use the following structure: new Variant ID_amount, or simply execute the endpoints with variant IDs + amount.

Don't worry, as all the changes will be made very gradually, and we will, of course, inform you as soon as there are any news relevant for you!

Can I find the corresponding ID from the “new world” for a certain product if I know its old ID?

Yes, the Client API provides an endpoint giving you the opportunity to convert the old ID to the new one and vice versa, if the product is available in both product catalogues: `/{country}/v2/catalog/convert`

A similar converter feature is provided also via the StartNOW V3.

Will I have a certain time period for the mapping update when a certain product switches to the new world with new variant IDs?

Absolutely! Both variant IDs (old and new) will be available within a specific time period to give you the opportunity and time for the necessary adjustments. You will be updated upfront on the potential deadlines and timeframes from our team.

More Details on Tech Part

Is there a file size limitation to be uploaded to the Client API?

The file size limit for the Client API is 1GB for the print data upload.

Once an order is placed and files are uploaded, how much time do I have to cancel the order?

Since the print data check after the uploading process is very fast, it can go into production in a few minutes after the upload. It is not possible to submit the cancellation after the status change.

Should I execute the whole product catalogue every time to see whether there are changes in a certain product group?

No, the Client API provides the so called “hash value” to show changes in the product group or product variant.

The execution of the endpoints below includes a line called "version" with its string in the response body. The changes in the string reflect the presence of changes in the product.

- /{country}/v2/catalog/groups/{product_group_id}
- /{country}/v2/catalog/groups/{product_group_id}/variants

You can also see the “last_change_date” in the response body (only for the product group).

Will the hash value or the last change date show the exact changes in the produt group/variant?

The details on the exact changes should be seen separately when you request information on the specific product group or variant.

Will the “hash value” value change with the changes in the product datasheet?

The datasheet changes do not affect the "hash" value, as the URL stays the same.

Is there a limitation on the possible amount of delivery addresses per order via the Client API?

The Client API provides the option of the multiple delivery addresses (up to 10 addresses per order) for **some products**. However, the option availability can also depend on the quantity of the same product.

It is possible to check the availability for a certain product via the corresponding endpoints: either via quantity ID or variant ID + amount.

How much time do I have to upload the according print data before the order gets cancelled?

Normally, the order is cancelled after 7 days of being not processed. There is currently no notification about non-uploaded print data. You are always in responsibility of checking the status from your side.

Is there a possibility to retrieve through the product variant or quantity ID the official store prices of the Flyeralarm webshop?

Yes, when you execute the desired variant ID via the following Client API endpoint to review its available quantity IDs, you will see two price fields: "price" and "msrp_price". While the field "price" represents the value according to your customer type, the highlighted "msrp_price" field represents the webshop price.

I could see on the webshop the product images available for the product variants. Is it possible to retrieve the images via the Client API?

The Client API does not include the product images in the provided information. In case of wish, we can provide you with an access to the Asset Library. It may provide you with the product pictures in an open Photoshop format editable from your side.

Please note that the Asset library is sorted by the product group names in German.

How can I request an access to the Asset Library?

We would need the information below to proceed with your access. Feel free to contact us via servcice@flyeralarm.pro for more details.

- Email address for access
- First and last name of the person having the access

The email address mentioned must be a corporate email address. We don't accept personal emails for the next steps.

Please note that Asset library is based on Microsoft Share, and it may lead to issues when Mail-Addresses are also used for Microsoft accounts.

Are all the images available in the Asset Library neutral for the usage?

Every new product since November 2022 got a white label image in our library. Parallelly, we have also added white label images for the already available products, starting with our topsellers. The team is constantly working on covering the whole product portfolio as soon as possible.

I could see on the FA webshop that the product attributes (e.g., material, format) are shown with the icons. Is it possible to retrieve them via the Client ?

The Client API does not provide icons in the product information. As the icons are just generic web images, stored in low resolution, they are not provided in the Asset Library to resellers from FA Pro.

On the FA webshop, it is possible to see an additionnal information on the attribute values (the exact code of the color, etc.). Are these details returned via the Client API?

The content from the “configuration window” is not provided via the Client API, as it is only the frontend information provided by FLYERALARM. Meanwhile, the Client API provides only the product data itself.

Is there a maximum number of request allowed to send for an endpoint execution?

The Client API does not have any rate limits (e.g., the maximum number of orders during a specific time). It may be planned in the future only if we see that the number of orders needs to be limited due to technical reasons.

Therefore, we kindly ask you to keep the request numbers as low as possible according to your needs for testing and/or order placement.

Can I have the product datasheets without the FA branding?

Yes, the Client API provides the white label datasheets for many products, and the according team is constantly working on expanding the availability of neutral datasheets. The datasheet availability will need to be checked for the certain product accordingly.

How the information/source on the white label datasheet is presented via the Client API?

You can see the necessary information, for example, in the endpoint for the variant IDs:
/{country}/v2/catalog/groups/{product_group_id}/variants
"id": 1039265,

"group_id": 11680,

"data_sheet": "https://www.flyeralarm.com/sheets/de/magazinkleb_fdh_a4_kl.pdf",

"data_sheet_wl": "https://www.flyeralarm.com/sheets/de_wl/magazinkleb_fdh_a4_kl.pdf",

"print_data_upload_required": true,

"quantities": [

You can recognise the path for the white label datasheets by the '_wl'. If no neutral data sheet is - yet - available for the product, the path is displayed as 'null'.

The according team is constantly working on expanding the availability of neutral datasheets. However, it will take some time before we are able to provide neutral datasheets for every product due to our product diversity and the different languages for which the datasheets still have to be created.

The order placed via the demo token of the Client API automatically shows the payment method as "prepayment". To which term should I change the field in the reuqest body in case of live "real" orders?

For the live orders you specify the payment method as "invoice" in the request body. However, you are not able to place live orders with a demo token.

You are free to place live orders with the live tokens. Furthermore, you can also make test orders with the live tokens, if you set the payment method as "prepayment" and don't pay for them.

We strongly recommend avoiding changing the default "prepayment" method for the demo tokens to avoid any confusion.

Does the Client API retrieves the size parameter information for the certain product group and/or variant?

While the API endpoint does not include the size parameters, they are always available in the according product datasheet for your review.

I receive the Client API error messages (e.g., print data check) in English. Is there a possibility to execute them in other languages too?

The Client API is currently based on English, providing the error messages (without IDs) correspondingly. Our team is constantly working on the improvements and possibilities to get the messages in various languages with IDs and frequent aligned updates. We will let you know as soon as there is any relevant news on this point.

Is there a way to see how many requests we have already made during a certain period from the response of a request?

The response header does not include the number of requests made during a certain period. So, the requests executed would need to be monitored from your side.

I have seen a frontend solution in the FA webshop, where the customer can upload an image or a PDF, and it is adjusted proportionally in a certain way. Does the Client API provide the neutral version of this function?

The white label version of the referred Quick Uploader is not available on the Client API, and plug-ins are also not provided at this moment.

The possible alternative solution might be our endpoint for the print data check with the product variant ID even before the order creation to build a similar non-branded visual uploader from your side.

Can I receive automatic updates on the order status or print data status change?

Yes, the Client API provides the opportunity to receive automatic notifications/updates on the following events via our webhooks:

1. order status
2. uploaded print data status
3. print data check status
4. tracking links

You are free to find all the relevant details and information about the webhooks in the according Webhook Information Sheet.

What I need to do or provide to benefit from webhooks?

You are free to manage (add, delete, change) your webhook URLs from the Client API documentation as described in the Webhook Information Sheet. You will receive the automatic notifications on the status changes through the URL.

When I create an order, the Client API only takes the shipping and invoice address. How can I set the return address?

The order placement endpoint of the Client API includes “sample examples” dropdown menu. You are free to choose the provided sample called “Extended Order” as your basis for further adjustments.

How can I be sure that my request body for the custom size products is structured correctly?

The order placement endpoint of the Client API includes “sample examples” dropdown menu. You are free to choose the provided sample called “Order with custom size attributes” as your basis for further adjustments.

How can I be sure that my request body for the textile products is structured correctly?

The order placement endpoint of the Client API includes “sample examples” dropdown menu. You are free to choose the provided sample called “Order with textile sizes” as your basis for further adjustments.

How can I be sure that my order request body with multiple delivery addresses is structured correctly?

The order placement endpoint of the Client API includes “sample examples” dropdown menu. You are free to choose the provided sample called “Order with multiple delivery addresses” as your basis for further adjustments.

How can I be sure that my order request body with numbering options is structured correctly?

The order placement endpoint of the Client API includes “sample examples” dropdown menu. You are free to choose the provided sample called “Order with numbering option” as your basis for further adjustments.

My chosen delivery country has additional local requirements to be filled in the request body for order placement. How can I be sure that my order request body includes all the necessary information and is structured correctly?

The order placement endpoint of the Client API includes “sample examples” dropdown menu. You are free to choose the provided sample called “Atomic order IT or ES or BE” (depending on the country) as your basis for further adjustments.

Is there any difference in the order request body if I place the order using the product quantity ID or the product variant ID + amount?

The order placement endpoint of the Client API includes “sample examples” dropdown menu. You are free to choose the “New order with Quantity ID” or “New order with variant ID and amount” option based on your preference and adjust it according to your order details.

Is it possible to check the allowed format of the print data after the order placement?

Yes, the Client API provides the following endpoint for the print data check based on the order ID:

`/{country}/v2/orders/{order_id}/print_data/allowed_format`

Is it possible to check the allowed format of the print data before the order placement?

Yes, the Client API provides the following endpoint for the print data check based on the variant ID:
`/{country}/v2/catalog/variants/{variant_id}/print_data/allowed_format`.

Please, note that the details level can still vary compared with the print data check based on the order placed, as the latter one uses different and already more detailed consequent information.

Is it possible to check the prepared print data before the order placement?

Yes, the Client API provides the following endpoint to upload the prepared print data file based on the product quantity ID or variant ID+amount:

`/{country}/v2/orders/check_print_data`

AND

the consequent endpoint to check the suitability of the uploaded print data:

`/{country}/v2/orders/print_data_checks/{print_data_check_id}`

Is it possible to check the allowed print data format or the prepared print data for the custom size products before the order placement?

Currently, the check of the print data allowed format or the prepared print data file is only possible after the order placement, through the following endpoint:
`/{country}/v2/orders/{order_id}/print_data/allowed_format`

The documentation for the print data field specifies that the payload should include a print_data key, but in some examples, print_data_url is being used instead. Are print_data and print_data_url interchangeable?

print_data and print_data_url are the alternative options on how you prefer to upload the print data. Depending whether you upload it directly from the device or by URL upload, you are free to choose the most comfortable option.

How are the delivery days for the ordered product calculated?

Each chosen product variant/quantity has a “deadline” mentioned in the Client API according endpoints and StartNOW V3 dashboard.

Looking at a product with a “deadline” of 12:00, which has the following delivery options:

ST (standard delivery): 3-4 days
EX (Express delivery): 1-2 days
ON (Overnight delivery)

*For ST and EX delivery options, if you place the order **before** 12:00:*

Day 0: The same order placement day (day of production)
Day 1 (EX earliest delivery)
Day 2 (EX latest delivery)
Day 3 (ST earliest delivery)
Day 4 (ST latest delivery)

*For ST and EX delivery options, if you place the order **after** 12:00:*

Day 0: The next working day (day of production)
Day 1: (EX earliest delivery)
Day 2: (EX latest delivery)
Day 3: (ST earliest delivery)
Day 4: (ST latest delivery)

For the ON (overnight) option, the delivery is the next day if the order was placed before the deadline (in this case 12:00).

Please note that all mentioned days are the work days to have the right calculation.
